Thermo Plastic Elastomer

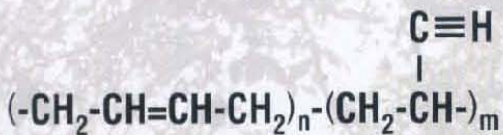

NR

Natural rubber is extracted in the form of latex from the bark of the Hevea tree. Natural rubber polymers have very good tensile strength and resistance to cutting, tearing, and abrasion, good resilience while low heat buildup, poor resistance to oil and greases.

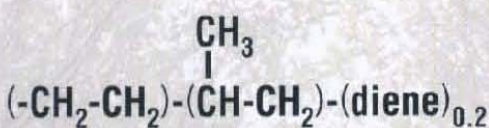

SBR

SBR have very good abrasion resistance, good mechanical properties, good heat and aging resistance, good electrical properties, and good resistance to polar solvents, acid and base solution.

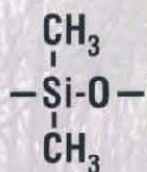

NBR

NBR have very good resistance to liquid fuels mineral oils and greases, good resistance to aging, high resistance to wear and abrasion, low permeability and good physiological properties.

EPDM

EPDM have excellent resistance to weathering and ozone good to very good aging resistance, and low temperature flexibility, low electrical conductivity and satisfactory resistance to polar chemicals.

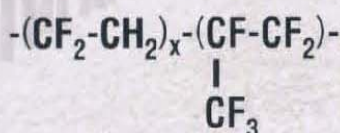

Silicone

Silicone rubbers have excellent resistance to ozone, oxidation and UV light. They also have very good resistance to moisture and weathering. The flexibility properties is very good.

Polyurethane

Urethane rubber have high tensile strength and abrasion resistance. They are good oil and tear resistance. The flexibility properties can vary depend on the formulation.

Fluoroelastomer

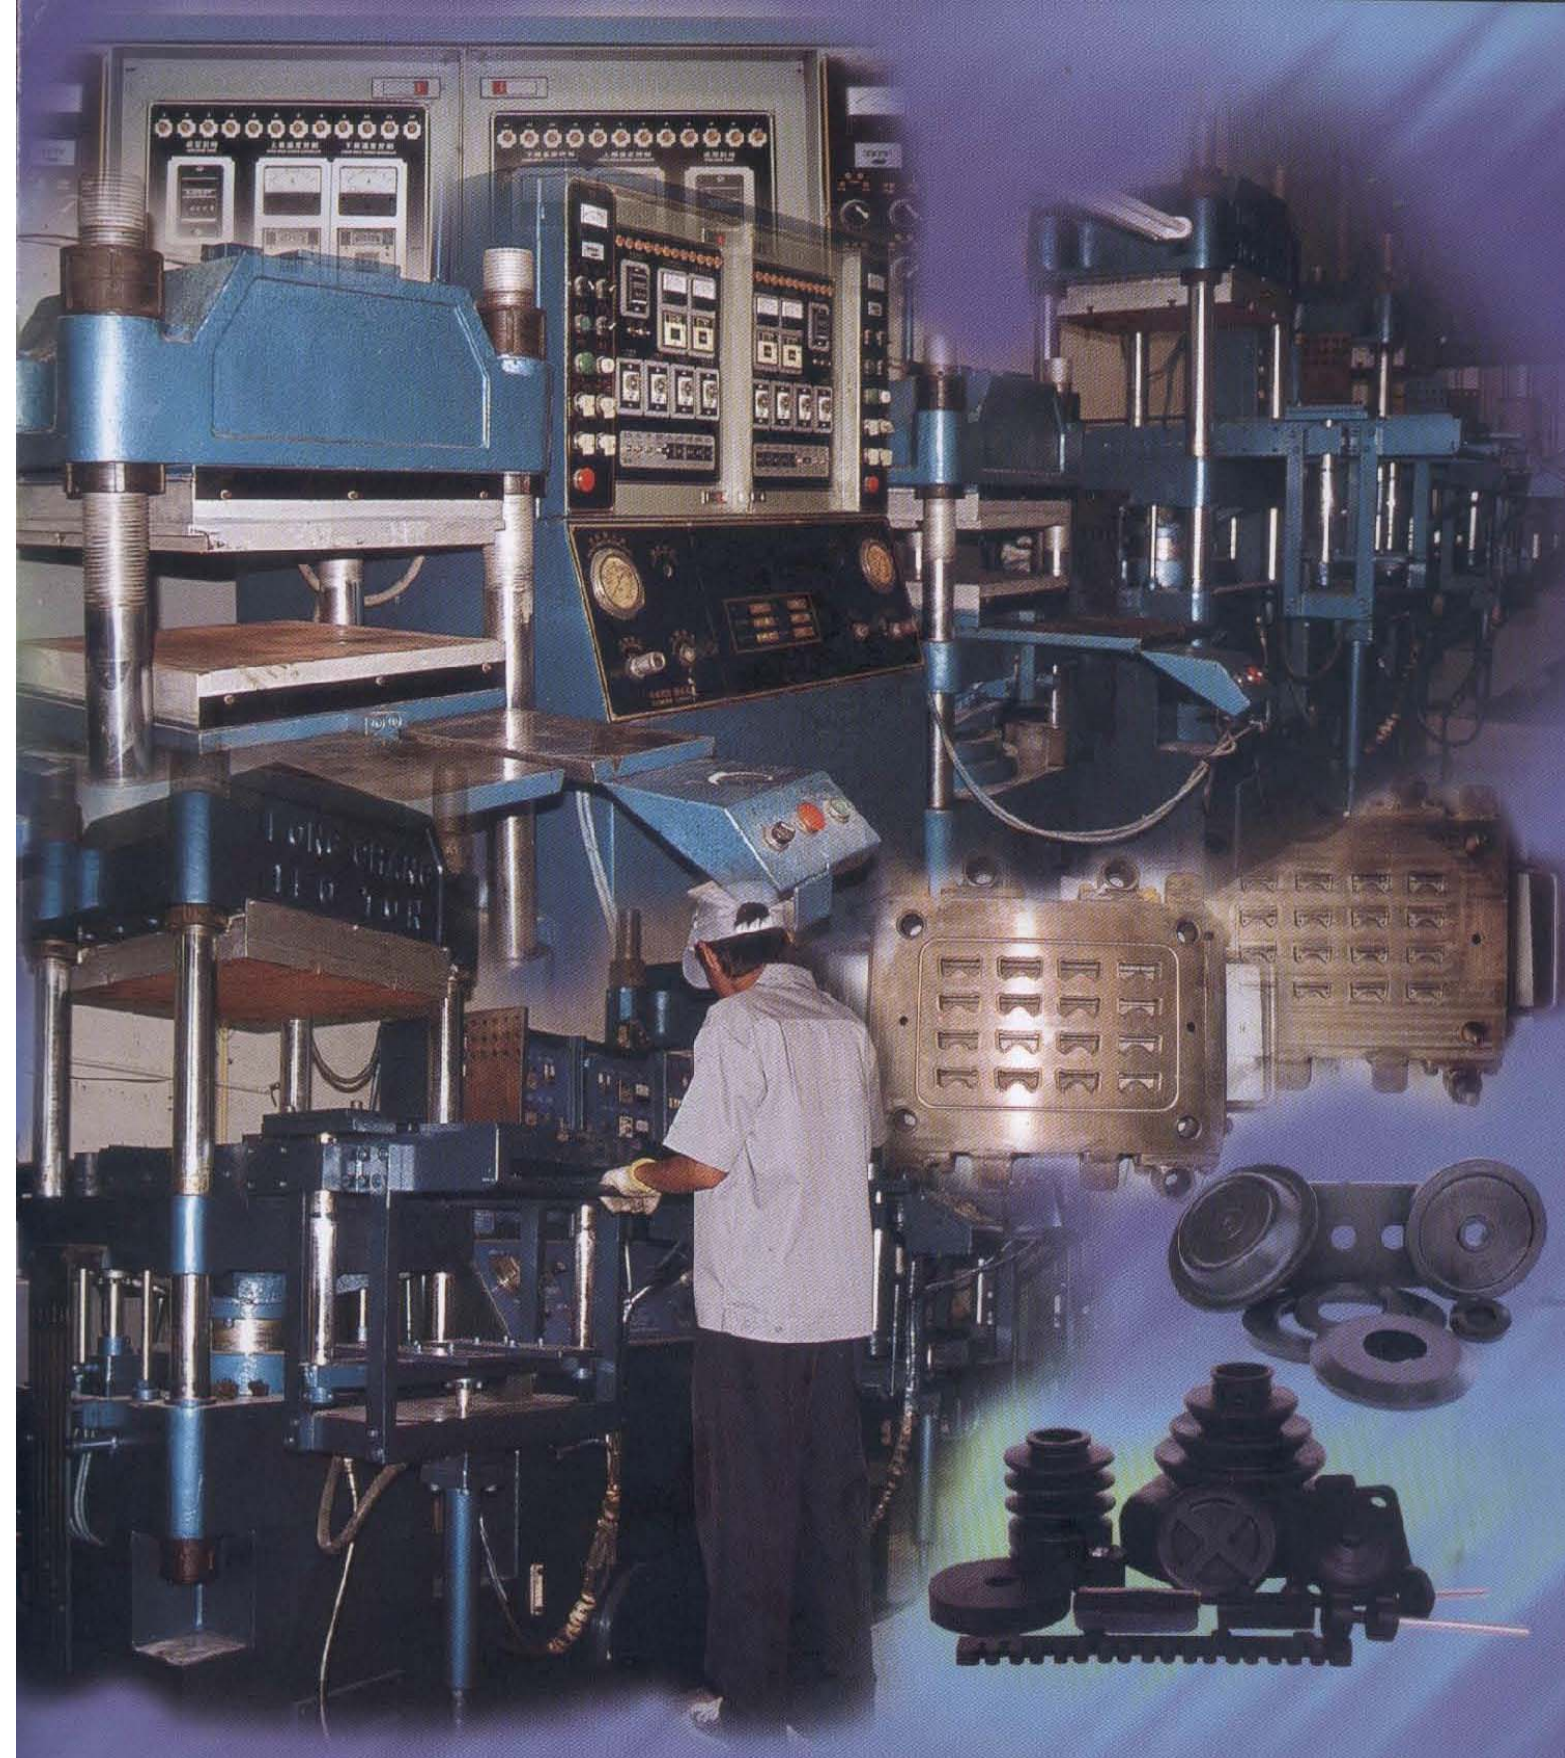

Fluoroelastomers are specialty elastomers have excellent heat resistance, excellence resistance to aggressive fuels and chemical. They have very good mechanical, physical properties, wear and abrasion resistance.
